

Argos99

Argos99 Resilience Platform

You can't protect what you can't see.

And you can't recover what you don't understand.

Most organizations have asset data scattered across dozens of tools.

It's stale. It conflicts with itself. And when something goes wrong, that lack of clarity costs time you don't have. Argos99 eliminates the blind spots. Built by the Fenix24 recovery team using real-world breach experience, Argos99 correlates live telemetry across your entire infrastructure to deliver a continuously updated, traversable model of every asset, every relationship, and every gap.

Core Capabilities

Asset Intelligence

Argos99 discovers and normalizes every entity in your environment from live sources. Servers, identities, IP addresses, network interfaces, hypervisors—all classified, all connected, all continuously updated. A device seen in one source is a data point. A device seen in three is a fact.

Application Dependency Mapping

Infrastructure becomes a business conversation. Argos99 maps which applications depend on which systems, identifies hubs and superconnectors, and shows how failure would propagate across your environment. You're not reconstructing blast radius after an incident. You already know it.

Backup Coverage Analysis

Argos99 evaluates backup protection at the application level, not just job status. A backup that covers the application server but misses a critical dependency isn't a recovery plan. It's a false sense of security. Argos99 shows you the difference.

Automated Recovery Planning

Recovery sequencing generated automatically from dependency relationships and backup status. Systems that other systems depend on get restored first. Critical applications with clean backup states get prioritized. No more manual runbooks that are wrong by the time you use them.

How It Works

- 1 CONNECT** | Integrates with 60+ security and infrastructure tools.
- 2 CORRELATE** | Normalizes every asset into a single, typed data model.
- 3 MAP** | Surfaces dependencies, gaps, and recovery posture.
- 4 ACT** | Generates live recovery plans and prioritized remediation.

Why Argos99

Built from breach experience. Argos99 was designed by the world's leading team that recovers organizations from ransomware. Every feature reflects what matters when systems are down and the clock is running.

Live data, not stale exports. Continuously correlated telemetry replaces the spreadsheets and CMDBs that are already outdated by the time you open them.

Business context, not just inventory. Argos99 connects infrastructure to applications and applications to recovery priorities. You can see risk and business impact in the same platform.

Critical Questions Argos99 Answers

Which endpoints in my environment have no EDR coverage? Argos99 cross-references your full device inventory against your security tooling in real time. Unprotected endpoints surface in seconds, not after an attacker finds them first.

Can I recover my most critical applications right now? Backup coverage is evaluated against the full dependency stack, not just individual jobs. If your ERP server is backed up but a critical dependency isn't, Argos99 flags the gap.

What is the blast radius if this system goes down? The knowledge graph renders full relationship maps for any entity. Traverse connections in any direction to see exactly which applications, servers, and services are affected.

How long have my critical vulnerabilities been open? Exposure age tracking shows not just what's vulnerable but how long it's been that way. A critical CVE open for 90 days is a

process problem, not a patching one. Argos99 surfaces both.

Which data sources are contributing to my security? Source coverage reporting shows exactly what integration contributes. Confidence in your asset data is a function of corroboration. The more sources that agree, the more complete and more reliable the picture.

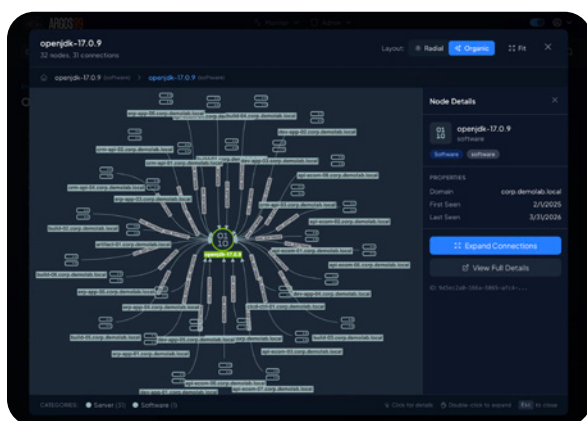

Integrations

Argos99 connects with 60+ tools across security, infrastructure, identity, and cloud platforms, including Active Directory, CrowdStrike, vCenter, Palo Alto, Azure AD, AWS, Veeam, and more.

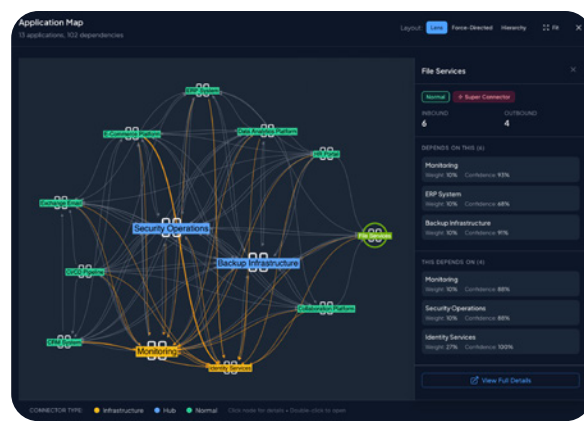

Powering Securitas Summa

Argos99 is one of four battalions in Fenix24's Securitas Summa program, the only cyber resilience offering that combines automated infrastructure mapping, hardening and resistance, managed protection, and a guarantee of rapid, zero-cost recovery. Argos99 provides the visibility foundation that makes the rest of the program possible.

ROC Recovery Readiness Dashboard

Argos99 automatically maps the relationships your team would spend hours tracing manually.

Argos99's application map shows exactly how your business systems are connected, so you know where failure propagates before it happens.

See Argos99 in Action

Argos99 gives you the insights and automation you need to recover faster, with less risk, less guesswork, and fewer surprises.
